FOR IMMEDIATE RELEASE

SPRI to revise and re-canvass Wind Design Standard for Vegetative Roof Systems

Waltham, MA, July 2023 — SPRI, the association representing sheet membrane and component suppliers to the commercial roofing industry, is revising, and re-canvassing a key technical document for re-approval as American National Standards.

ANSI/SPRI RP-14 “Wind Design Standard for Vegetative Roofing Systems.” ANSI/SPRI RP-14 provides a method of designing for wind uplift resistance of vegetative roofing systems. Growth media, stones, pavers or combinations thereof provide the ballast or weight needed for vegetative system(s) to resist wind uplift forces. Thus, this standard helps identify the ballast type to resist uplift forces, as well as drainage options. This standard was last approved as an ANSI Standard in 2022. During the 2022 review there were changes identified that will improve the document and remove extraneous information. This current revision will incorporate those changes.

Those wishing to participate in the canvass process for this document may contact SPRI at info@spri.org.
